

**ABSTRACT**

A dialing device is used in company with a cell phone in a vehicle, wherein the driver writes down on a handwriting device a name or a number of a person to be telephoned. After a control unit identifies the written data, the control unit actuates a miniature projector to project an image on a windshield. Therefore, by directly reviewing the windshield, the car driver can easily check whether the name or the number to be dialed is correct without stopping looking at the road ahead.
